Franse LV, Di Bari M, Shorr RI, Resnick HE, van Eijk JTM, Bauer DC, Newman AB, Pahor M, for the Health, Aging, and Body Composition Study Group: Type 2 diabetes in older well-functioning people: who is undiagnosed? Data from the Health, Aging, and Body Composition Study. *Diabetes Care* 24:2065–2070, 2001

In the first sentence under CONCLUSIONS on page 2067, “one-third of all older individuals” should read “one-third of all older individuals with diabetes.” The paragraph containing the correct sentence is shown here:

The present study shows that about one-third of all older individuals with diabetes remain undiagnosed. In this study of healthier older adults, men, those with a history of hypertension, and those with high BMI and large waist circumference were at the highest risk of having undiagnosed diabetes. Screening for diabetes may be more efficient among these subgroups, especially among individuals with combinations of these risk factors, in which the NNTS [number needed to screen] to identify one undiagnosed diabetic individual was lowest.

In the first complete sentence on page 1903, “ $336 \div (336 + 552) = 29.8\%$ ” should read “ $336 \div (336 + 552) = 37.8\%$.” The sentence containing the correct calculation is shown here:

The projected positive predictive value (proportion of actual cases among those who have positive tests) would be $336 \div (336 + 552) = 37.8\%$.

In Table 2 on page 1779 of the above article, the units of measure under the row headings “F wave minimum latency in median” and “F wave minimum latency in tibial” were listed incorrectly because of a composition error. The correct table is given on the following page.
