

SUPPLEMENTARY DATA

**Supplementary Figure S1. Subject disposition.**

Percentages are based on randomized participants. The trial was initiated 25 November 2013, total trial duration was 58 weeks and consisted of a 2-week screening period, a dose initiation and escalation period of 2–4 weeks, a maintenance period of 48–52 weeks (dependent on dose/dose escalation scheme) and a 4-week follow-up period. The trial was completed 04 June 2015.

## SUPPLEMENTARY DATA

### Supplementary Figure S2.

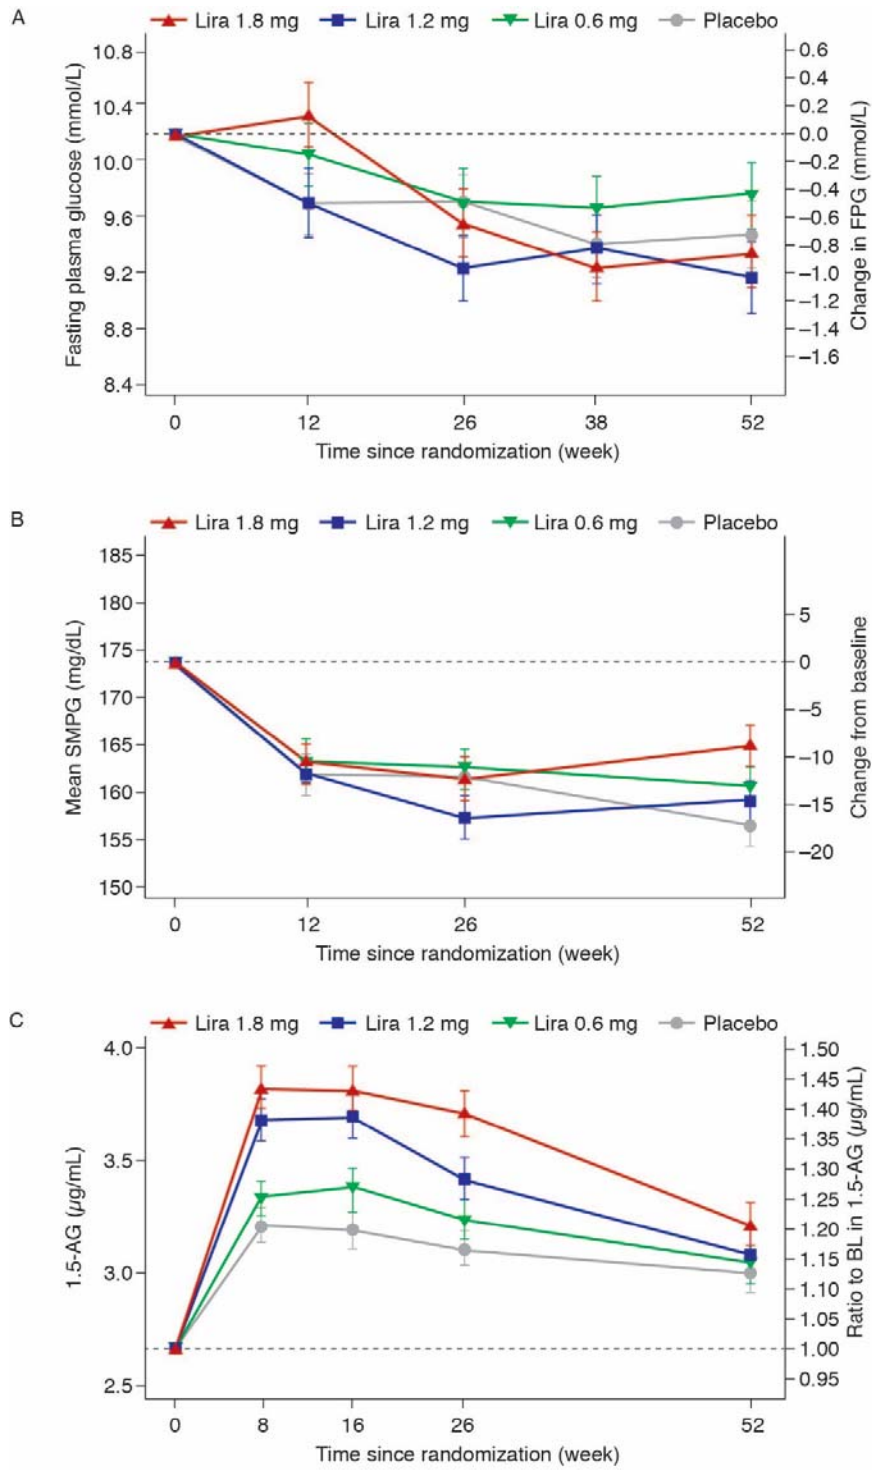

**Panel A. Change in FPG (mmol/L) by treatment week.** On-treatment analysis. Group mean estimates ( $\pm$ SEM) are from a mixed model for repeated measurements with treatment, stratification and country as fixed factors, and baseline value as a fixed covariate, all nested within visit.

**Panel B. Change in mean of 9-point SMPG (mmol/L) by treatment week.** On-treatment analysis. Group mean estimates ( $\pm$ SEM) are from a mixed model for repeated measurements with treatment, stratification and country as fixed factors, and baseline value as a fixed covariate, all nested within visit.

**Panel C. Change in 1,5-AG (ug/mL) by treatment week.** On-treatment analysis. Group mean estimates ( $\pm$ SEM) are from a mixed model for repeated measurements on the log-transformed post-baseline responses with treatment, stratification and country as fixed factors, and baseline value as a fixed covariate, all nested within visit. Group mean estimates are adjusted according to the observed baseline distribution and back transformed to the original scale. Error bars are calculated on the log scale before being back transformed to original scale.

## SUPPLEMENTARY DATA

### **Supplementary Table S3. Event adjudication committee (EAC)-confirmed pancreatitis.**

The participant was randomized to 0.6mg liraglutide and had the following medical history: duration of type 1 diabetes of 37 years, diabetic retinopathy, diabetic nephropathy, hypertension, hyperlipidemia, hay fever, vitamin D insufficiency, and never smoked.

At 144 days after start of treatment with trial product, the participant was hospitalized due to acute central abdominal pain, which radiated to the back. The participant reported that the pain did not increase after eating, and that there was no vomiting, fever or rapid pulse. Cardiac investigations were without abnormal findings. An abdominal ultrasound was performed and no intra-abdominal pathology detected. Computed tomography of the abdomen and pelvis noted appearances compatible with pancreatitis. C-reactive protein was 31.0 mg/L (reference range: 0-8 mg/L). Lipase was 25 U/L (reference range: 0-60 U/L). Four preferred terms were reported covering the event ('pancreatitis', 'abdominal pain', 'back pain' and 'nausea'), all assessed as possibly related to trial product by the investigator. The participant was withdrawn from the trial due to the acute pancreatitis and recovered.

On treatment analysis. The number of events is analysed using a negative binomial regression model with a log-link and with treatment, C-peptide, country, stratification, and the interaction between treatment and subgroup as factors, baseline HbA<sub>1c</sub> as a covariate, and the logarithm of the exposure time as offset. Symptomatic hypoglycemic episodes are episodes that, according to Novo Nordisk definition, are either severe according to the ADA definition or are accompanied by a plasma glucose value <3.1 mmol/L (56 mg/dL), with symptoms consistent with hypoglycemia.
